## The I3docstrip package Code extraction and manipulation\*

The LaTeX3 Project<sup>†</sup> Released 2012/06/08

## 1 Extending DocStrip

The <code>I3docstrip</code> module adds LATEX3 extensions to the <code>DocStrip</code> program for extracting code from <code>.dtx</code>. As such, this documentation should be read along with that for <code>DocStrip</code>.

## 2 Internal functions and variables

An important consideration for IATEX3 development is separating out public and internal functions. Functions and variables which are private to one module should not be used or modified by any other module. As TEX does not have any formal namespacing system, this requires a convention for indicating which functions in a code-level module are public and which are private.

Using l3docstrip allows internal functions to be indicated using a "two part" system. Within the .dtx file, internal functions may be indicated using @@ in place of the module name, for example

```
\cs_new_protected:Npn \@@_some_function:nn #1#2
{
    % Some code here
  }
\tl_new:N \l_@@_internal_tl
```

To extract the code using <code>l3docstrip</code>, the "guard" concept used by <code>DocStrip</code> is extended by introduction of the syntax %<@0=(module). The (module) name will be used when the code is extracted to replace the @0, so that

```
%<*package>
%<@@=foo>
\cs_new_protected:Npn \@@_some_function:nn #1#2
```

<sup>\*</sup>This file describes v3787, last revised 2012/06/08.

<sup>†</sup>E-mail: latex-team@latex-project.org

```
{
          % Some code here
    }
     \tl_new:N \l_@@_internal_tl
%</package>
will be extracted as
    \cs_new_protected:Npn \__foo_some_function:nn #1#2
          {
                % Some code here
          }
          \tl_new:N \l__foo_internal_tl
where the __ indicates that the functions and variables are internal to the foo module.
```
